## Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

## Listing of Claims:

- (Currently Amended) A system for heating a fluid for delivery into a body of a patient comprising:
  - a fluid delivery-line comprising:
    - a tube for communicating a fluid;
- <u>three [[two]]</u> or more thermal sensors, at least one thermal sensor positioned approximate to each end of the tube <u>and at least one thermal sensor positioned in between the</u> ends of the tube; and
- a heating element positioned proximate a surface of the tube to heat fluid within the tube, the heating element being controlled based on temperature data from the [[two]] three or more thermal sensors to generate [[a]] two or more determined heat gradients through the fluid within the tube.
- (Original) The system according to claim 1, further comprising a controller.
- (Previously Presented) The system according to claim 1, wherein the heating element is spaced apart from an outer surface of the tube.
- (Original) The system according to claim 1, wherein a wall of the tube comprises a
  thermal medium for distributing heat received by the outer surface of the tube from the heating
  element.
- (Original) The system according to claim 1, wherein the heating element surrounds the tube

- (Original) The system according to claim 1, wherein the heating element spirally surrounds the tube.
- (Original) The system according to claim 1, wherein the heating element comprises a plurality of heating elements surrounding the tube and having a length positioned substantially parallel to a length of the tube.
- (Original) The system according to claim 1, wherein the heating element comprises a
  plurality of heating elements, each circumferentially surrounding the tube and spaced apart from
  one another along a length of the tube.
- 9. (Original) The system according to claim 1, wherein the heating element is surrounded by a thermal medium
- (Previously Presented) The system according to claim 9, wherein the thermal medium comprises a fluid.
- (Previously Presented) The system according to claim 1, wherein the fluid delivery-line includes a bag spike positioned at one end.
- 12. (Previously Presented) The system according to claim 1, wherein the fluid delivery-line includes a transfusion needle and/or a luer lock at one end.
- 13. (Currently Amended) The system according to claim 2, wherein the heating element and/or the [[two]] three or more thermal sensors are in electrical contact with the controller.
- 14. (Previously Presented) The system according to claim 2, wherein the controller is connected to a power source.

- 15. (Previously Presented) The system according to claim 14, wherein the power source is selected from the group consisting of: a one-time use battery pack, a rechargeable battery pack, AC power, and DC power.
- 16. (Original) The system according to claim 1, wherein the tube is sterile prior to use.
- (Original) The system according to claim 2, wherein the controller provides an electrical current to the heating element.
- 18. (Previously Presented) The system according to claim 17, wherein the controller controls the temperature of the tube by sensing a temperature corresponding to a temperature of fluid within the tube and adjusting the amount of current supplied to the heating element.
- 19. (Original) The system according to claim 2, further comprising a heat element connector and/or a thermal sensor connector for connecting the heat element and thermal sensor, respectively, to corresponding connectors on the controller.
- (Original) The system according to claim 1, further comprising a valve.
- 21. (Previously Presented) The system according to claim 20, wherein the valve comprises a temperature actuated valve that opens upon the temperature of the fluid within the tube reaching a predetermined value.
- (Previously Presented) The system according to claim 1, further comprising a metering
  means for determining a flow rate of fluid traversing through the tube.
- 23. (Previously Presented) The system according to claim 1, further comprising a heat-

conductive member having a first portion placed adjacent an interior portion of the tube and a second portion placed proximate the heating element, wherein the heat-conductive material transfers heat from the heating element to the interior portion of the tube.

- 24. (Previously Presented) The system according to claim 1, further comprising an insulative tube, wherein the tube is positioned within the insulative tube.
- 25. (Previously Presented) The system according to claim 24, further comprising a thermal medium positioned between the tube and the insulative tube.
- (Previously Presented) The system according to claim 25, wherein the thermal medium envelops the heating element.

27-30. (Canceled)

31. (Currently Amended) A system for heating a fluid for delivery into a body of a patient comprising:

a controller; and

a fluid delivery line having a first end for receiving fluid from a fluid source and delivering the fluid to a destination, the fluid delivery line comprising:

an insulative tube:

- a fluid delivery tube positioned within the insulative tube, the fluid delivery tube for communicating a fluid;
- <u>three [[two]]</u> or more thermal sensors, at least one thermal sensor positioned proximate <u>to each end of</u> the fluid delivery tube <u>and at least one thermal sensor positioned in</u> between the ends of the tube:
- a heating element positioned proximate the fluid delivery tube, the heating element being controlled based on temperature data from the [[two]] three or more thermal

sensors to generate [[a]] two or more determined heat gradients through the fluid within the tube; and

a thermal medium positioned between the insulative tube and the fluid delivery

32. (New) The system according to claim 1, wherein the fluid delivery-line delivers the fluid to a destination at a constant flow rate.

tube.
